DSi screen not responding

This morning, I turned on my DSi. When the default message showed, I pressed A to continue, not noticing what was wrong. On the menu screen, I tried to touch Web, but nothing happened. I pressed A, and nothing happened. The only buttons that were working were the Power, Left and Right. I even pressed L+R+Start+Power and got to the calibration screen, but the system would not respond if you tried to touch the targets. I understand that I will have to send my DSi in for repairs, but I would like to know any possible causes for this. Thank you for any support.

Bump? Or something?

Is your system old? Maybe it crashed on something and stopped working. You will just have to contact nintendo.

Not really, it's only about 1 year old.

After Nintendo repairs your DSi, and it is shipped back to you, your repaired DSi will come with a slip of paper that gives you a brief report of the repairs they did, such as which components were fixed, and what might have caused the problem.
DSi screen not responding

Ah, thank you. 😊
