Hello,

I just purchased an Aqua Blue 3DS yesterday, and didn't notice this until tonight:

When I have my system running on battery, the bottom screen flickers a lot when running certain programs. The big one is the Pokedex 3D. The screen is totally fine when the system is plugged into the wall, but as soon as I unplug it again, the flicker comes back. I'm curious as to why it would do something like this. Is there a fix, or is it something that would need repaired/replaced? I've looked everywhere, and I can't find anyone else online with a similar problem.

Thanks in advance!

i think it may just be that the battery in not in the system right and you may want to open the battery compartment and pull the battery out and pop it back in as fast as you can or the system will reformat. if you don't want to do that call Nintendo and ask them what you can do. plus also you are not part of the ambassador program correct if so you can return the system if you don't want to go thoure the hassle of sending it in for repairs.

I am not sure how it happened, but it could be damaged. Or the battery is wack. Either way, try calling Nintendo at 1-800-255-3700
also, if you just purchased it yesterday, depending on where you bought it you might be able to exchange it at the store for a new one if you still have the receipt.
